VOL. XXXVII.

FEBRUARY, 1932.

No. 2.

GENERAL SUMMARY.

The abnormally warm weather that marked the preceding two winter months continued throughout February and resulted in a monthly average temperature that has been exceeded only three times since State-wide weather records were inaugurated in 1888. The average daily excess for the combined three months' temperature record is nearly 9°. A long-standing maximum temperature record for the month was broken when a reading of 83° was made at Hyndman during the afternoon of the 11th. The previous record was 81°, established at Confluence in 1900. The temperature showed an excess over normal on all but eight days over most of the State, with minima for most stations occurring mostly on the 1st in the western counties and on the 21st in eastern sections. The highest for the month was registered quite generally on the 11th west of the mountains and on the 26th in the eastern portion of the State. Precipitation averaged but slightly over half the February normal, with the greatest amounts being reported from extreme northeastern counties, in which section heavy local storms early in the month helped to increase the total. The driest section was in the western tier of counties, in which region totals of less than one inch were the rule. Snowfall averaged slightly more than 25% of the normal amount and the snow did not lay long in any section. The snow for the three winter months averaged but 5.3 inches, or slightly more than one-sixth the amount to be expected in a normal winter. At the end of the month winter grains were in mostly excellent condition, despite the lack of consistent snow-cover. In many of the southeastern sections the frost penetration never exceeded one inch all winter, while in the colder sections the frost depth rarely exceeded 8 to 12 inches. Ice harvesting was begun in a few northeastern sections during the last week, with the quality only medium. In many sections where an ice crop is usually available none had been cut up to the end of the month. The month was an ideal one for all outdoor activities and generally free from damaging storms, with the exception of a severe electrical storm, rare for February, in the Scranton area, which resulted in some damage from flooded cellars and mine cave-ins. Flood stages were exceeded at a few stations on the Monongahela River during the first week of the month, but no serious damage was reported.

F. H. A.

TEMPERATURE.

The mean temperature for the State, as deduced from the observations taken at 90 stations, was 35.3°, which is 7.2° in ex-

cess of the February normal. The highest monthly mean was 41.2°, at Uniontown, and the lowest was 26.2°, at Gouldsboro. Extremes of temperature ranged from a maximum of 83° at Hyndman on the 11th to a minimum of -8° at Gouldsboro on the 25th. The greatest daily range of temperature was 48° at Hyndman on the 11th.

PRECIPITATION.

The average precipitation for the State, as deduced from reports taken at 145 well-distributed stations, was 1.64 inches, which is 1.33 inches less than the normal for the month. The greatest monthly amount was 4.24 inches at Hollisterville, while the least amount, 0.62 inch was recorded at Newell. The greatest amount recorded in any 24 consecutive hours was 2.20 inches at Hollisterville on the 10-11th. Snowfall for the month averaged 2.9 inches, which is 8.0 inches less than the normal for February. The greatest monthly snowfall was 21.5 inches at Pleasant Mount, where also occurred the greatest 24-hour fall of 8.8 inches on the 27th.

COMPARATIVE DATA FOR FEBRUARY

GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXVII.

MARCH, 1932.

No. 3.

## GENERAL SUMMARY.

March was the coldest month of the winter season, being 4.6° colder than December, 7.1° colder than January, and 1.9° colder than February. It was a very blustery and disagreeable month from first to last. At Philadelphia the wind movement for the month exceeded all records with an average hourly velocity of 15.8 miles. Strong winds occurred almost daily, but the excess in movement was increased greatly by two severe coast storms. The first of these storms occurred on the 6th and 7th. Gales of wind caused widespread damage, such as the prostration of telephone, telegraph, and electric lines, and the destruction of forest trees. The accompanying rainfall was heavy in the southeastern counties, where it changed to snow before the storm ended. In the mountain regions the precipitation was largely snow, which drifted badly in the heavy gales, and delayed or stopped traffic for periods ranging from 24 to 48 hours. The papers stated that about three-fourths of the State spent Easter Monday in digging out of a snowfall of six to fifteen inches, which drifted as much as twelve to fifteen feet deep in some places. The other storm, which was only slightly less severe, centered about the 27th, the strongest winds occurring generally on the 26th and the heaviest precipitation on the 28th. The heaviest snowfall for the month, in the southeastern counties, occurred during a comparatively moderate storm on the 21st. These combined storms gave the State an average snowfall of 14.7 inches, or more than twice as much as the March normal. It was 6.5 inches more than had fallen from November 1931 to February 1932, inclusive. Frost penetrated the soil quite deeply in March for the first time during the winter season. It stopped the growth of the winter grains, and killed all grasses that had remained green up to that time. The season's ice harvest was conducted wholly in March, when the Pocono region reported ice eleven inches in thickness. There was no ice worth harvesting in the southeastern portion of the State. At the end of the month it was reported that the winter grains were not greatly damaged by freezing, which had occurred in such a manner that there was little upheaving of the soil. Fruit buds were damaged in some sections, and a few pessimistic reports were received.

## TEMPERATURE.

The mean temperature for the State, as deduced from the observations taken at 90 stations, was 33.4°, which is 4.3° less than the March normal. The highest monthly mean was 39.9°,

at Phoenixville, and the lowest was 24.9°, at Gouldsboro. Extremes of temperature ranged from a maximum of 72° at Hyndman on the 30th to a minimum of -8° at Somerset on the 16th. The greatest daily range of temperature was 49° at Chambersville on the 12th.

## PRECIPITATION.

The average precipitation for the State, as deduced from the reports taken at 149 well-distributed stations, was 4.41 inches, which is 0.97 inch above the normal for the month. The greatest monthly amount was 7.46 inches at West Chester, while the least amount, 1.63 inches was recorded at Ansonia. The greatest amount recorded in any 24 consecutive hours was 3.40 inches at Neshaminy Falls on the 27-28th. Snowfall for the month averaged 14.7 inches, which is 7.8 inches greater than the normal for March. The greatest monthly amount of snow was 41.0 inches at Morris Run. The greatest 24-hour snowfall, 19.0 inches occurred at Lock Haven on the 27-28th.

## COMPARATIVE DATA FOR MARCH

PHILADELPHIA, PA.

VOL. XXXVII.

APRIL, 1932.

No. 4.

## GENERAL SUMMARY.

April was abnormally cool and dry. The temperature deficiency was nearly two degrees. The precipitation averaged only one-half of the April normal. The temperature deficiency was a continuation of the March cold in a modified form. Frosts covered the greater portion of the State at the beginning of the third week but without much damage as vegetation was generally backward due to the low temperature of the soil. Most of the precipitation occurred in the second week, and a moderate drought developed during the remainder of the month. The effects of the drought were most noticeable in the slow growth of the pastures and meadows. Heavy local snows occurred in a few places, but for the State as a whole the snowfall was lighter than usual, and only traces were reported from about one-third of the stations. The large percentage of fair weather during the last half of the month was favorable for field work, which was well advanced. Oats seeding was nearly finished in the southern counties, and most of the corn ground was ready for planting at the close of the month. However, the top soil was a little too dry, and the subsoil was a little too cold for a wholly favorable opening of the crop season. Winter wheat and rye came through the cold months with little damage, and at the end of April these grains were generally looking good, and were making a fine growth. Early field potatoes were mostly planted in the southeastern counties, and were being planted in the central counties at the end of the month. Truck gardening was in full swing. Orchard fruits suffered from freezing in some sections, but for the State as a whole the condition was better than the average. There was an unusual amount of windy and blustery weather, which made it seem more like March than April. Only one severe local storm was reported, and the Stroudsburg Record claimed that it was a tornado. It passed over the town of Tobyhanna, in Monroe County, on the afternoon of the 26th. It unroofed a few houses and destroyed a few smaller buildings. The damage was all done within a few minutes time, and there were some other characteristics of a tornado. One man in the village claimed to have seen a funnel cloud.

## TEMPERATURE.

The mean temperature for the State, as shown by the reports from 87 stations, was 47.0°, which is 1.7° less than the April normal. The highest monthly mean was 52.6°, at Marcus

Hook, and the lowest was 36.2° at Mt. Pocono. Extremes for the month ranged from a maximum of 86° at Marcus Hook and Phoenixville on the 22d, to a minimum of 14° at Ridgway on the 3d, and at Elk Lick on the 4th. The greatest daily range of temperature was 56° at Clearfield on the 20th and 22d.

## PRECIPITATION.

The average precipitation for the State, as determined from the observations taken at 146 stations, was 1.71 inches, which is a deficiency of 1.73 inches as compared with the normal for the month. The greatest monthly total was 3.73 inches at Greenville, while the least, 0.58 inch, was reported from Forest City. The greatest amount recorded in any 24 consecutive hours was 1.66 inches at Greenville on the 25-26th.

Snowfall for the State averaged 1.2 inches, which is 1.3 inches less than the normal. The greatest monthly total snowfall was 9.0 inches at Clearfield and the greatest 24-hour amount, 5.3 inches, fell at Erie on the 11-12th.

## COMPARATIVE DATA FOR APRIL

| Year                     | Temperature |         |        | Precipitation |          |       | No. of days |               |        |                        |

PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.

PHILADELPHIA, PA.

VOL. XXXVII.

MAY, 1932.

No. 5.

## GENERAL SUMMARY.

The temperature average for the month was slightly above the May normal, yet cold periods centered near the 3d and 23d, respectively, when frosts covered the greater portion of the State with severe freezing in some places. The first period was most severe in the western, and the second period in the eastern portions of the State. No extensive damage was done to field crops, but tender garden plants suffered considerably. The temperature rose sharply after the second cold period, and maxima for the month were recorded generally on the 25th or 26th. Most of the rainfall occurred during the second week, the last general rain being on the 13th. After that date there were many places that received no rain to the end of the month, while moderate showers relieved conditions over a few narrow paths. These showers were mostly in the eastern portion of the State, and apparently covered only about one-third of that territory. At the close of the month many complaints were received of a shortage of moisture in the drier regions. Fair weather was favorable for field work which made rapid progress during the last half of the month. Corn planting was nearly finished in the southern portion of the State, and first plantings were coming up. Wheat was heading during the last week, much of it on short straw. Oats made a good growth wherever the soil moisture was sufficient, while the growth was slowed up considerably in the drier regions. At the close of the month the pastures and meadows were showing a need of moisture in the greater portion of the State. Alfalfa was a single exception, and a good crop was ready for cutting. Early varieties of potatoes were looking good, but the beetles were becoming numerous in many sections, and were seriously damaging the later plantings. Orchard fruits seemed to be doing well. There were several reports that peaches made a light setting, but some ventured the opinion that such a condition would bring an improvement in quality that would more than balance the loss in quantity. The berry crop was promising with strawberries in full bloom in the southern counties. There were no severe or damaging storms during the month, and no hail of consequence occurred.

## TEMPERATURE.

The mean temperature for the State, as shown by the reports from 89 stations, was 59.8°, which is 0.4° above the normal for

May. The highest monthly mean was 65.4° at Marcus Hook, and the lowest was 52.0° at Mt. Pocono. The highest temperature recorded during the month was 98° at Lock Haven on the 25th, while the lowest, 71°, was recorded at Somerset on the 3d. The greatest daily range of temperature for the month was 59° at Clearfield on the 24th.

## PRECIPITATION.

The average precipitation for the State, based on the reports from 147 well-distributed stations, was 3.69 inches, or a deficiency of 0.21 inch under the normal. The greatest monthly total was 6.40 inches at Warren, while the least, 1.00 inch, was reported from Vandergrift. The greatest amount recorded in any 24 consecutive hours was 2.45 inches at Center Hall.

The normal snowfall for the State is a trace, but no stations reported any during the month.

## COMPARATIVE DATA FOR MAY

| Year          | Temperature |         |        | Precipitation |          |       | No. of days |               |        |                        |

VOL. XXXVII.

JUNE, 1932.

No. 6.

GENERAL SUMMARY.

June temperatures averaged somewhat above the normal, and yet one of the most destructive June frosts of recent years occurred on the 8th. Freezing temperatures were recorded at one-fourth of the stations, while frosts covered the greater portion of the State. Many gardens were ruined, and some damage was done to field crops and to orchard fruits. This frost followed an excessively warm week. The rainfall averaged about three-fourths of the June normal, but such a statement conveys no idea of the conditions on account of the uneven distribution that occurred. The monthly rainfall ranged from 0.73 inch at Beaver to 7.08 inches at Mt. Pocono. In a general way the excess in rainfall occurred in the mountain districts, leaving the driest regions in the northern and western counties. It so happened that the northern counties received a large excess of rainfall in May, so the June shortage did little or no damage, but in the western counties the rainfall was deficient for both May and June, which resulted in a drought condition that became alarming. This dry region comprised a section about sixty miles wide across the western end of the State. Crop growth in this belt came practically to a standstill, and prospective yields were greatly reduced. Corn suffered least of all crops in the dry regions, and was generally reported good. Some was laid by at the close of the month. Wheat made most of its development before the drought became severe, but suffered in many places from rust and from the fly. It was ripening rapidly at the close of the month, and harvest had begun in a few places. Oats was hard hit in the dry regions and developed very short straw. Much of the crop headed out at ten or twelve inches in height, and reports said that such fields would be mown for hay. The potato crop was good wherever the rainfall was sufficient, except for unusual damage by Colorado beetles. Orchard fruits were mostly fair. Apples gave promise of yields nearly up to the ten year average. Peaches made a light setting. Cherries were a large crop, but many rotted on the trees. Pears seemed to be about an average crop. The greater portion of the June rains accompanied thunderstorms, many of which were severe. On the 18th a house near Honesdale was struck by lightning, and a resulting explosion was said to have resembled that of a bomb. The furniture in one room was completely destroyed. On the night of the 21st a severe storm did much damage in the vicinity of Johnstown. Two men were killed by lightning. The accompanying rainfall was excessive, and did much damage by wash-

ing fields. UNIVERSITY OF ILLINOIS

TEMPERATURE.

The mean temperature for the State, as shown by reports from 88 stations, was 68.5°, which is 0.6° warmer than the June normal. The highest mean 74.8° was recorded at Marcus Hook, and the lowest 56.2°, was reported from Mt. Pocono. The highest temperature for the month was 98°, recorded at Lewisburg on the 7th and 29th. The lowest for the month was 26°, at Mt. Pocono and Somerset on the 8th. The greatest daily range of temperature was 49° at Hyndman on the 25th.

PRECIPITATION.

The average precipitation for the State, as shown by the reports of 146 stations, was 3.15 inches, which is a deficiency of 1.03 inches as compared with the June normal. The greatest monthly amount was 7.08 inches at Mt. Pocono, while the least was 0.73 inch at Beaver Falls and Ingram. The greatest amount recorded in any 24 consecutive hours was 3.47 inches at Philadelphia Navy Yard on the 17th.

The departures from normal temperature and precipitation are computed only from records for stations that have ten or more years of observation, but all complete reports are used in determining means for the State. † On other dates also.

Reference letters, a, b, c, etc., indicate, respectively, 1, 2, 3, etc., days missing from the record. T, indicates precipitation less than .01 inch, rain or melted snow.

If Post-Office addresses are as follows: of Beaver Dam, Beaver; of Elk Lick, Salisbury; of Lycippus, Greensburg; of Neshaminy, Oakford; of Sharon, Farrell; of Shawmont, Manayunk.

PHILADELPHIA, PA.

VOL. XXXVII.

JULY, 1932.

No. 7.

GENERAL SUMMARY.

The mean temperature for the month was exactly the same as the July normal, and there were no unusual extremes. The rainfall averaged slightly more than three-fourths of the July normal, the shortage occurring during the second and third weeks. The rainfall was less than three inches in nearly one-half of the State. This shortage followed an equal deficiency for June, and resulted in a drought condition that stunted the growth of most crops. The subsoil became dry, and light to moderate showers furnished little relief because the moisture quickly disappeared by seepage and evaporation. Wheat harvest was practically finished during the first week. A large portion of the crop was threshed before the end of the month with only moderate yields. Corn generally made a good growth, being little affected by the drought excepting the driest regions. However, it was apparent at the close of the month that good soaking rains were needed immediately to insure a proper earing of the crop. Oats was badly stunted by the drought, and developed short straw in nearly all parts of the State. There were very few really good fields, while a large part of the crop was too short for binding, and it was reported that such fields were being mowed for hay. Grasslands suffered severely from the drought. Pastures generally became short and weedy, and turned brown in some sections, while the second crop of hay made a poor showing. More or less relief was afforded in the greater portion of the State by heavy thundershowers at the beginning of the fourth week, but the run-off was generally so heavy that the moisture did not reach the subsoil to any extent. Tobacco made a poor growth. It was set out in the fields at about the time that the drought got well under way. At the close of the month it seemed to be the poorest crop for many years. There were about the usual number of severe local storms during the month. A small tornado passed over the town of Freeland on the 2d, doing considerable damage with no loss of life. Its path was about six miles in length, and ended near the mining village of Eckley. On July 1st a severe thunderstorm did considerable damage in Carlisle and vicinity. On the 15th a damaging thunderstorm passed over the Pittsburgh region. Many buildings were struck by lightning, and many fires resulted. Hail did much damage in the Scranton region on the 17th, breaking thousand of windows. The hailstones were large enough in some instances to penetrate the tops of automobiles. Many severe thunderstorms were reported in the central and eastern portions of the State from the 20th to 22d inclusive. They brought much needed rain, but their benefits were largely offset by the resulting damage from wind and lightning.

TEMPERATURE.

The mean temperature for the State, as shown by the reports from 89 stations, was 72.0°, which is just normal. The highest monthly mean was 79.2° at Marcus Hook, and the lowest was 59.6° at Gouldsboro. The highest temperature recorded was 100°, at Lewisburg on the 1st and 14th, and at Carlisle, Lock Haven and Sharon on the 19th. The lowest temperature recorded was 36° at Kane on the 3d. The greatest daily range in temperature was 47° at Hyndman on the 7th, Lykens on the 19th, Butler on the 24th, Wellsboro and Bradford on the 25th, and at Brookville on the 26th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations taken 146 well-distributed stations, was 3.39 inches, which is 0.90 inch below the normal for the month. The greatest monthly amount was 9.65 inches at Confluence, and the least was 0.85 inch at Sunbury. The greatest amount recorded in any 24 consecutive hours was 2.93 inches at Confluence on the 22d.

PHILADELPHIA, PA.

VOL. XXXVII.

AUGUST, 1932.

No. 8.

## GENERAL SUMMARY.

August was hot and dry, and served to further intensify a drought condition that began in the greater portion of the State during April. The excess in temperature increased the harmful effects of the shortage in moisture by hastening the maturity of crops before growth and development reached the proper stages. This drought condition is comparable with that of 1930, and in some parts of the State it is even more intense. Early planted corn, comprising approximately two-thirds of the crop, withstood the drought in July fairly well, and was in condition to develop fairly large ears during the early part of August. That portion of the crop is fully up to the ten-year average. Later plantings were badly stunted, and many fields developed only nubbins. A large portion of these late plantings was used for ensilage, and silo filling was in full swing during the last week. Pastures and meadows suffered severely from the drought. Pastures became very short and weedy, and at the end of the month they gradually had the appearance of late September. The second crop of hay was light in most places, but was mostly cured during favorable weather, and with small losses. Wheat ground was largely prepared for seeding by the end of the month, but the soil was extremely dry, and it was evident that the beginning of seeding would await more favorable conditions. Potatoes were reported in all conditions from poor to good. The drought was not quite so severe in the chief potato growing regions as it was in the greater portion of the State. Truck crops, excepting tomatoes, were only fair, and were deteriorating steadily during the latter part of the month. Tobacco was generally the poorest crop for many years. The drought was becoming well established at the time that plants were set out in the fields, and they were handicapped from the start. There seemed to be fewer local storms of a severe character than usually occur during August. On the 7th there were severe thunderstorms in Lancaster County during which many buildings were struck and fired by lightning. Damage that was reported was estimated to be between \$30,000 and \$40,000. Some damage by lightning was reported from Montgomery County on the same date, a large barn and its contents being burned, value \$3,000.

## TEMPERATURE.

The mean temperature for the State, as deduced from the reports of 88 stations, was 71.6°, which is 1.6° in excess of the normal for August. The highest monthly mean was 78.8° at Marcus Hook, and the lowest was 60.4° at Gouldsboro. Extremes of temperature ranged from a maximum of 103° at Lock Haven on the 31st, to a minimum of 34° at Kane on the 20th. The greatest daily range in temperature was 53° at Wellsboro on the 16th.

## PRECIPITATION.

The average precipitation for the State, as shown by the reports from 143 stations, was 2.82 inches, which is 1.35 inches less than the normal for the month. The greatest amount for the month was 6.81 inches at Reading, while the least, 1.09 inches, occurred at Harrisburg. The greatest amount recorded in any 24 consecutive hours was 3.94 inches at Reading on the 7th.

## COMPARATIVE DATA FOR AUGUST

| Year                     | Temperature |         |        | Precipitation |          |       | No. of days |               |        |                        |

# CLIMATOLOGICAL DATA.

32

PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.

PHILADELPHIA, PA.

VOL. XXXVII.

SEPTEMBER, 1932.

No. 9.

## GENERAL SUMMARY.

September was moderately warm and extremely dry. The first date was very hot, and established a new September maximum of 105°, the previous high record being 104°. The temperature continued much above the normal for six days, and accumulated a large excess which was later reduced to an average of 1.1° for the month. This was the second driest September of record, and prolonged a drought condition that began in June. The drought was most severe, generally, in the eastern half of the State, where it was more intense than the drought of 1930. There were several counties in the southwestern portion where it was equally severe, but the condition was not quite so general. For the State as a whole, the accumulated deficiency of rainfall from June to September inclusive was 5.29 inches, while for the same period in 1930 it was 5.91 inches. However, this shortage does not tell the whole story of cause and effect. In June of 1930 the rainfall averaged slightly above the normal, and the very large deficiency accumulated after that period. In June of this year the average deficiency was a little more than an inch, this shortage occurring at a critical time in the crop growing season. As a result, the winter grains and all of the early crops in 1930 matured under favorable conditions, while this year many crops were suffering from a lack of moisture as early as the middle of July. September of this year closed a crop season that was the most unfavorable in many respects that has occurred in many years. It seems that there has been a shortage of deep soil water since the drought of 1930, and this condition quickly sapped the moisture from the top soil after each rain. During September many reports were received to the effect that the ground was dusty dry to a depth of five or six feet. The observer at Mount Pocono reported that forest fires burned the roots of trees down to a depth of three feet underground in some places. The dry condition seemed to favor a rapid multiplication of insect pests that did a large amount of damage. Potato beetles were more numerous and destructive than for many years, and the Japanese beetle season was prolonged from two to three weeks later than usual. The seeding of winter wheat, which ordinarily is mostly done during the last half of September, was delayed and was mostly carried over into October. Pastures dried up so rapidly that there was little feed during the month. Late corn did not develop ears, and was mostly cut for ensilage. Tobacco was set out in the fields at the

beginning of the drought, and was the poorest crop for many years.

## TEMPERATURE.

The mean temperature for the State, as shown by the reports from 88 stations, was 65.2°, an excess of 1.1° as compared with the September normal. The highest monthly mean was 72.4° at Holtwood, and the lowest, 54.9° at Gouldsboro. Extremes for the month ranged from a maximum of 105° at Hyndman and Lewisburg on the 1st, to a minimum of 23°, at Wellsboro on the 26th and 30th and at Somerset on the 30th. The greatest daily range of temperature was 58°, at Butler on the 19th.

## PRECIPITATION.

The average precipitation for the State, as determined by the reports of 145 well-distributed stations, was 1.45 inches, which is 2.01 inches less than the September normal. The greatest monthly amount was 3.43 inches, at Pleasant Mount, while the lowest, 0.48 inch, was reported from Selinsgrove. The greatest amount recorded in any 24 consecutive hours was 2.03 inches, at Chambersburg on the 4-5th.

## COMPARATIVE DATA FOR SEPTEMBER

| Year          | Temperature |         |        | Precipitation |          |       | No. of days |               |        |                        |

32 PENNSYLVANIA SECTION.  
GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.  
Vol. XXXVII. OCTOBER, 1932. No. 10.

GENERAL SUMMARY.

Temperatures in October were seasonable, and the extremes for the month were moderate. There was a slight excess in the mean temperature, and yet the maximum for the month was not as high as usual. Frosts did little damage as crops matured rapidly in September and were mostly out of danger before freezing occurred. The rainfall excess in October was just enough to balance the deficiency of September. The first heavy rains occurred near the end of the first week. They averaged about four inches in the central and eastern portions of the State, and, though generally moderate, they were the heaviest for the month at most places in the western part of the State. Ponds, reservoirs, and small streams were quickly filled to overflowing, and good stages were re-established in the larger rivers. The top soil was drenched, and the summer drought condition was ended. However, the run-off was fairly rapid in such heavy rains, and on well drained lands the moisture did not penetrate below a depth of ten or twelve inches. In flats and valley lands the water continued to seep down for several days, and generally put the deep soil in good condition. A second period of fairly heavy rains occurred in the central and eastern counties during the middle of the third week. These rains came at a slower rate and generally extended over a period of about 48 hours. The percentage of run-off was less than for the first rains, and the moisture penetrated to a depth of two feet or more. In the Ohio drainage area the rainfall averaged near the October normal with little of the excessive order. There were more rainy days with light to moderate rainfall, and the soil retained nearly as much moisture as it did in the Susquehanna and Delaware basins. Grass started to grow after the first rains, and near the end of the month it was furnishing some feed. The seeding of winter grains was in progress when the first rains occurred, and was finished thereafter as rapidly as the condition of the fields would permit. Corn husking was well advanced at the close of the month, being from two to three weeks ahead of usual conditions on account of its early maturity. Strong winds on the night of the 26th did some damage to wires, especially in the Susquehanna Valley from Williamsport to Lock Haven. At the end of the month the early sown winter grains were generally looking good, while late sown fields were rather short, but otherwise in a healthy condition.

TEMPERATURE.

The mean temperature for the State, as shown by the reports from 89 stations, was 53.8°, an excess of 1.4° as compared with the October normal. The highest monthly mean was 60.3°, at Marcus Hook, and the lowest 44.2°, at Mt. Pocono. Extremes

for the month ranged from a maximum of 86°, at Hyndman on the 3d, to a minimum of 20°, at Gouldsboro on the 14th, and at Kylertown and Somerset on the 31st. The greatest daily range in temperature was 47°, occurring at Clearfield on the 2d, Hyndman and Greenville on the 8th, Wellsboro on the 9th, and Franklin on the 15th.

PRECIPITATION.

The average precipitation for the State, as determined by the reports of 146 well-distributed stations, was 5.31 inches, which is 2.05 inches more than the monthly normal. The greatest monthly amount was 11.90 inches, at Newport, while the least, 1.78 inches, was reported from Sharon. The greatest amount reported in 24 consecutive hours was 5.82 inches, at Gordon on the 5-6th. The average snowfall for the State was a trace which is 0.3 inch less than the normal for October. The greatest amount of snow reported was 1.0 inch, which fell on the 13th at Kylertown. Several places reported traces of snow on the 12th and 13th.

GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXVII.

NOVEMBER, 1932.

No. 11.

### GENERAL SUMMARY.

This was the coolest November since 1917, and yet the average temperature deficiency for the State was a little less than two degrees. The State mean was practically ten degrees lower than for November of last year. There were no wide departures from the normal on either side until the 27th and 28th when a moderate cold wave brought zero temperatures to a few places, and generally lower temperatures than were recorded in all of last winter. There was little freezing in the southern counties during the first three weeks, and lawns remained green in most places. The rainfall was above the normal in nearly all parts of the State with a large excess in the Delaware Basin. Many stations in that district reported from twice to three times their normal November rainfall, and deep soil water was generally restored. Many wells and springs that were dry in September and October were replenished, and the surface water supply was excessive. In the eastern portion of the State there were four periods of heavy rains due to a succession of coast storms, and fields and unimproved roads were muddy excepting the last week. However the early maturity of crops, and the favorable weather for field work in October left little to be finished in November. Corn husking and potato digging were nearly finished in October. Winter grains did not grow much after the 10th, but all excepting the latest seedings had become fairly well established by that time, and were looking good. The heavy rains of the 9th and 10th were attended by severe gales in the eastern portion of the State. Many buildings were damaged, and many large trees uprooted. Traffic was badly delayed during the storm, and four persons were killed in Philadelphia and vicinity. The cold wave of the 27th and 28th came in with gales that were almost as severe as the storm of the 9th and 10th. Wind velocities exceeded 40 miles per hour at Philadelphia in each of these storms. The month as a whole was thoroughly disagreeable, especially in the eastern portion of the State, but heavy rains were badly needed to make up for a large accumulated deficiency, and to replenish the surface water supply for the winter season.

### TEMPERATURE.

The mean temperature for the State, as shown by the reports from 88 stations, was 39.4°, which is 1.8° below the November normal. The highest monthly mean was 46.8°, at Marcus Hook,

and the lowest 32.6°, at Gouldsboro. Extremes for the month ranged from a maximum of 75° at Elk Lick and Uniontown on the 7th, to a minimum of -2° at Kane (near) on the 27th. The greatest daily range in temperature was 46°, occurring at Clearfield, Stroudsburg and Ridgway on the 30th.

### PRECIPITATION.

The average precipitation, from rain, sleet and melted snow, for the State, as deduced from the observations of 147 stations, was 4.75 inches, which is 1.89 inches above the November normal. The greatest monthly amount was 9.11 inches at Doylestown, while the least, 2.30 inches, was recorded at Clymer. The greatest amount recorded in any 24 consecutive hours was 3.58 inches at Gordon on the 1st. Snowfall averaged 0.3 inch, compared with a normal November amount of 2.5 inches. The greatest monthly total snow was 3.7 inches at Bradford, at which station the greatest 24-hour snowfall for the month, 2.5 inches, fell on the 13th.

### COMPARATIVE DATA FOR NOVEMBER

VOL. XXXVII.

DECEMBER, 1932.

No. 12.

## GENERAL SUMMARY.

The opening and closing weeks of December were unseasonably mild, and the accumulated temperature excess was greater than the accumulated deficiency for the abnormally cold period that intervened. The greatest departures on the mild side occurred on the 7th and 25th when temperatures averaged about 20 degrees above the normal. Lowest temperatures occurred generally from the 16th to 19th inclusive, when there was an average deficiency of from 12 to 15 degrees. There were no unusual extremes. Intense cold was of short duration, and lakes and ponds did not accumulate ice of sufficient thickness to be worth harvesting. Precipitation, which averaged a little more than two-thirds of the December normal, was wholly out of the usual order. The heaviest snowfall was in the southeastern part of the State, and the lightest in the northern tier of counties. This condition is usually reversed. The rainfall was generally heaviest in the western counties, where it exceeded the normal in a few places. Most of the snow in the southeastern part of the State occurred on the 17th and 18th under the influence of a coast storm, it having been preceded by a light snow on the 10th and 11th. The monthly snowfall exceeded ten inches in York, Lancaster, Chester, Delaware, Philadelphia, Montgomery, and Bucks counties, and was generally less than five inches across the northern portion of the State. Moderate cold prevailed from the 9th to the 17th with very little snow cover on the fields, and frost penetrated the ground to a depth of from six to twelve inches. It left the soil with the melting of the snow, and there was very little heaving to damage the roots of winter wheat and rye. At the end of the month there was very little frost in the ground, and the winter grains were looking good excepting the fields that were seeded so late that the grain was short when growth was stopped by general freezing. Drought at the usual seeding time resulted in late seeding for a fairly large portion of the crop, and at the close of December there was an apparent danger of considerable winter killing. The soil was well soaked by the heavy November rains, and the water supply throughout December was ample, the ponds being well filled, and the small streams flowing at moderate stages. The snow of the 17th and 18th was the only heavy storm experienced during the month.

## TEMPERATURE.

The mean temperature for the State, as shown by the reports from 94 stations, was 33.3°, or 2.2° above the December nor-

mal. The highest monthly mean was 40.4°, at Philadelphia, and the lowest 24.6° at Mount Pocono. The highest recorded during the month was 72°, at Vandergrift on the 25th, while the lowest was -14° at Brookville on the 16th. The greatest daily range in temperature was 53°, at Somerset on the 20th.

## PRECIPITATION.

The average precipitation, from rain, sleet and melted snow, for the State, as deduced from the records of 144 well-distributed stations, was 2.19 inches, which is 0.97 inch less than the normal for the month. The greatest monthly amount was 4.14 inches at Punxsuatawney, and the least was 0.51 inch at Montrose. The greatest amount recorded in any 24 consecutive hours was 1.86 inches at Erie on the 30th-31st. Snowfall averaged 7.4 inches, compared with the December normal of 7.9 inches. The greatest total snowfall for the month was 14.0 inches at West Chester, and the greatest amount in 24 hours was 10.0 inches at Shawmont on the 17th.

## COMPARATIVE DATA FOR DECEMBER

VOL. XXXVII. ANNUAL SUMMARY, 1932. No. 13.

## GENERAL SUMMARY.

The year as a whole was abnormally warm and dry. It was the sixth consecutive year with an excess in temperature, and the third with a deficiency of precipitation. The mean temperature has been exceeded only three times in the last 44 years. January was the warmest of record with an excess of 12.6 degrees, while the February mean has been exceeded only three times. Temperature departures for the remainder of the year were not large. March was moderately cold with a deficiency of 4.3 degrees. Summer temperatures were mostly on the high side of the normal, but there was little intense heat. Precipitation for the year was 92 per cent of the normal, yet a summer drought developed, that, in many respects, was the most severe of record, not being exceeded by the notorious summer of 1930. A rainfall shortage was recorded each month from April to September inclusive, with an accumulated deficiency for that period of 7.23 inches. The deficiency for the same period in 1930 was 7.35 inches, but the general effect on crop growth in that season was less severe by reason of a normal rainfall in June, covering a vital period in crop development. Another reason for the disastrous effects of the 1932 drought was the depleted water supply in the deep soil, accumulating over a period of three years. This brought about a condition which permitted the surface water to seep away rapidly, and light to moderate rains were of little lasting benefit. The first complaints of the drought were received at the end of May, when there were many reports that the winter grains were heading on short straw, and that pastures and meadows were showing a need of moisture. Alfalfa, a deep rooting plant, was a single exception, and a good crop was ready for harvesting. By the end of June the drought had become serious, especially in a belt about sixty miles in width across the western end of the State. In addition to the drought damage, one of the most destructive June frosts of record occurred on the 8th. Freezing temperatures occurred at one-fourth of the stations, and many gardens were practically ruined, while field crops suffered considerably. The drought continued to intensify through July, and conditions became alarming. Much of the oats crop was headed on straw too short to cut. Pastures and meadows became short and weedy, and turned brown in some sections. Corn was least damaged of all of the crops, and early plantings generally made a good growth. Local thundershowers, which constituted most of the rainfall, were severe in character, and considerable damage by winds and lightning was re-

ported. August, which may be considered as a crop maturing month, brought no relief. Late planted corn developed only nubbins, and was mostly cut for ensilage. The second crop of hay was very light. Pastures developed an October aspect, and the potato crop seemed to be at a standstill. September was extremely dry, and ended one of the poorest crop seasons ever known in Pennsylvania. The soil became dust dry in many regions to a depth of five or six feet. October and November rains were excessive, breaking the drought, soaking the deep soil, and generally replenishing the water supply. December precipitation averaged a little more than two-thirds of the normal amount, with the heaviest falls in the western counties, while the northern tier of counties showed the lightest amounts. A coast storm on the 17-18th was attended by heavy snows in southeastern sections of the State, and brought the State average snowfall very close to the December normal.

## COMPARATIVE DATA (ANNUAL)

| Year     | Temperature |           |         |        | Precipitation |           |                 |              |                   | Number of days                 |       |               |

PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.

PHILADELPHIA, PA.

VOL. XXXVIII.

JANUARY, 1933.

No. 1.

## GENERAL SUMMARY.

The month as a whole was decidedly mild, the mean temperature for the State being exceeded only in January of 1890 and 1932, respectively. The extremes were moderate, the maximum of 71 degrees having been exceeded nine times in the last 45 years, while the minimum of 6 degrees below zero has been exceeded in all but seven of the last 45 years. The month started with a moderate cold wave, after which the temperature was almost constantly above the normal, reaching an excess of 20 degrees or more at the beginning of the fourth week. Frost did not penetrate the ground deeply at any time during the month. Precipitation averaged a little less than two-thirds of the January normal, and was deficient in all parts of the State. Excepting 1931, it was the driest January during the last twenty years. The snowfall averaged 1.9 inches as compared with a normal of 11.0 inches. Most of the snow fell on the 9th. The heaviest snowfall for the month was a little more than 10 inches in Wayne County, where the normal is about 14 inches. A large number of stations reported only traces, and it appears that about one-fifth of the State was without a measurable amount of snow. There was no snow cover on the fields worth mentioning, but mild temperatures made it unnecessary. Winter grains that were seeded early enough last fall to become well rooted went through the month in good condition. However, it became increasingly apparent during the month that the losses would be heavy in late sown fields. A severe coast storm on the 26th caused destructive gales in Philadelphia and vicinity. Many trees, poles, and signs were blown down, and in numerous instances large plate glass windows were blown in. An old three-story frame house on Seltzer street collapsed during the storm. Fortunately it was unoccupied at the time and there was no loss of life. This storm was followed two days later by another wind storm of almost equal severity. This storm moved eastward from the central valleys and passed off the coast on the night of the 27th. It then increased greatly in intensity and caused gales along the entire Middle Atlantic seaboard. Streams were at moderate or low stages during the month, but the water supply appeared to be ample in all districts. The month as a whole was favorable for outdoor work, including building construction, which made good progress. Road work was almost entirely unhampered by frost or other conditions, and was conducted under nearly as favorable conditions as prevail during the warmer season.

## TEMPERATURE.

The mean temperature for the State, as shown by the reports from 89 stations, was 37.0°, or 9.1° above the January nor-

mal. The highest monthly mean was 42.8°, at Marcus Hook, and the lowest 30.2°, at Gouldsboro. The highest temperature recorded during the month was 71° at Clairton and Uniontown on the 22d, while the lowest, -6°, occurred at Kane (near) and Hawley on the 1st. The greatest daily range in temperature was 43° at Brookville on the 1st.

## PRECIPITATION.

The average precipitation for the State, as deduced from the observations of 146 well-distributed stations, was 2.00 inches, which is a deficiency of 1.25 inches as compared with the normal. Monthly totals ranged from a maximum of 3.43 inches at Waynesburg to a minimum of 0.54 inch at Lawrenceville. The greatest amount recorded in any 24 consecutive hours was 1.65 inches at Marcus Hook on the 25-26th. Snowfall averaged 1.9 inches which is 9.1 inches below the normal. The greatest monthly amount of snow was 10.6 inches at Pleasant Mount, and the greatest 24-hour fall was 7.5 inches at Lakeville on the 9-10th.

## COMPARATIVE DATA FOR JANUARY

| Year        | Temperature |           |         |        | Precipitation |           |                  |               |                  | No. of days           |       |               |        |

PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.

PHILADELPHIA, PA.

VOL. XXXVIII.

FEBRUARY, 1933.

No. 2.

## GENERAL SUMMARY.

The month was moderately warm excepting a four-day period which began with a cold wave on the 8th and extended over the 12th. The temperature excess for the month averaged a little more than three degrees. There have been thirteen warmer Februarys during the last forty-five years. The temperature extremes were not unusual. Two-thirds of the Februarys have recorded lower temperatures than the minimum of  $-15^{\circ}$ , and one-third of them higher temperatures than the maximum of  $68^{\circ}$ . The lowest temperatures for the month were recorded at most places on the 12th, which was the last day of the chief cold period, and the highest temperatures were recorded about the 24th. Precipitation was generally below the normal excepting the Delaware drainage basin where heavy snows occurred on the 11th under the influence of a coast storm. In consequence of this storm, the snowfall for the month was generally in excess of the February normal in the eastern third of the State, while it was generally below the normal elsewhere. The greatest monthly snowfall in the State was 26.0 inches at Gouldsboro, on the Pocono Plateau. In this region the ground was snow-covered nearly the whole month. Elsewhere it was covered from eight to fifteen days. Frosts did not generally penetrate the ground deeply, and there was little heaving of the soil by freezing and thawing. In consequence, the winter grains that became well rooted last autumn made a good showing, while late and short fields deteriorated considerably. The last half of the month was favorable for outdoor work, which made fair progress. Road building work continued in the southeastern counties, and some plowing was done. The wind movement for the month was rather large owing to the cold wave disturbance from the 7th to 10th, immediately followed by the coast storm of the 11th and 12th, and supplemented by a three-day period of strong winds and gales at the close of the month. Despite this large wind movement, there was little wind of a really damaging character. The sunshine for the month was a little more than the February average.

## TEMPERATURE.

The mean temperature for the State, as deduced from the observations taken at 87 stations, was  $31.3^{\circ}$ , which is  $3.2^{\circ}$  in excess of the February normal. The highest monthly mean was  $36.7^{\circ}$ , at Philadelphia (Weather Bureau), and the lowest  $23.3^{\circ}$ ,

at Gouldsboro. Extremes of temperature ranged from a maximum of  $68^{\circ}$  at Hanover and Phoenixville on the 24th, to a minimum of  $-15^{\circ}$  at Muncy Valley on the 12th. The greatest daily range in temperature was  $53^{\circ}$  at Hawley on the 13th.

## PRECIPITATION.

The average precipitation for the State, as shown by reports of 145 well-distributed stations, was 2.30 inches, which is 0.67 inch less than the normal for the month. The greatest monthly amount was 4.31 inches at Snow Hill, while the least amount was 0.73 inch at Wellsboro. The greatest amount for any 24 consecutive hours was 1.90 inches and was reported at Snow Hill on the 10-11th.

Snowfall for the month averaged 9.4 inches, which is 1.8 inches less than the normal for February. The greatest monthly snowfall was 26.0 inches at Gouldsboro, and the greatest 24-hour fall was 12.0 inches at Gouldsboro and Matamoras on the 10-11th.

## COMPARATIVE DATA FOR FEBRUARY

GEORGE S. BLISS, Meteorologist.

PHILADELPHIA, PA.

VOL. XXXVIII.

MARCH, 1933.

No. 3.

## GENERAL SUMMARY.

The month was unusually stormy and blustery, even for March. A small temperature deficiency gave it a wintry feel, while large excesses of precipitation and of wind movement combined to make the conditions thoroughly disagreeable. Precipitation averaged the heaviest for any March of record, and was above the normal in all parts of the State. The greatest excesses were in the southeastern and southwestern counties. Several stations recorded monthly amounts in excess of seven inches. The snowfall averaged a little less than the March normal, with heaviest snows in the northwestern portion of the State and in Somerset, Cambria, Luzerne, and Wayne counties. Monthly amounts of ten inches or more fell over an area equivalent to about ten counties. In the chief wheat growing regions the snowfall averaged from three to four inches, and covered the fields only a small portion of the month. At the close of the month the winter grains were rated considerably below the condition of last year. There was much winter killing in fields that were sown too late last autumn to become strongly rooted. Grass lands entered the winter season in rather poor condition owing to an extremely dry fall, and at the close of the month they were rated considerably below the average. Sunshine was much below the normal, being less than thirty per cent of possible over a large portion of the State. The conditions were unfavorable for outdoor work of all kinds. Fields were muddy, and building and construction and road work made little progress. The stream stage was above the normal, and streams in the Ohio drainage basin were flooded on the 14th and 15th. The resulting damage was unimportant. Minor damage occurred in wind storms, but the large wind movement was occasioned by many hours of strong winds rather than severe local storms. An ice storm occurred in a large portion of the mountain district from the 19th to 21st inclusive, and caused considerable damage to wires. Taken as a whole this was the most disagreeable month of the winter.

## TEMPERATURE.

The mean temperature for the State, as deduced from the observations taken at 88 stations, was 36.6°, which is 1.1° less than the March normal. The highest monthly mean was 42.2°, at Marcus Hook, and the lowest 28.2° at Gouldsboro. Extremes

of temperature ranged from a maximum of 79° at Hyndman on the 14th to a minimum of -7° at Kane (near) on the 11th. The greatest daily range in temperature was 51° at Lykens on the 17th.

## PRECIPITATION.

The average precipitation for the State, as deduced from the reports taken at 145 well-distributed stations, was 5.33 inches, which is 1.89 inches above the normal for the month. The greatest monthly amount was 8.95 inches at Elk Lick, while the least amount, 2.74 inches, was recorded at Erie. The greatest amount recorded in any 24 consecutive hours was 3.36 inches at Clymer on the 13-14th. Snowfall for the month averaged 5.6 inches, which is 2.1 inches less than the normal for March. The greatest monthly amount of snow was 20.5 inches at Warren and Kane (near). The greatest 24-hour snowfall was 7.0 inches and fell at Franklin on the 25-26th.

## COMPARATIVE DATA FOR MARCH

VOL. XXXVIII.

APRIL, 1933.

No. 4.

GENERAL SUMMARY.

Temperatures averaged above the April normal, chiefly due to warm periods during the first and third weeks. However, frosts and freezing occurred later than usual during cold periods at the beginning and ending of the fourth week. The lowest temperature for the month was recorded at most places on the 23d, with freezing in practically all parts of the State. Freezing occurred in about three-fourths of the State on the 27th and 28th, after which the temperature rose sharply, and the highest for the month was generally recorded on the 29th. Frost damage was confined chiefly to orchard fruits, of which peaches suffered most. They were generally in full bloom on the 23d, and on level or valley lands the fruit was nearly all killed. In most regions the freezing lasted only a few hours, and where topography favored good air drainage much of the fruit survived. Early varieties of apples suffered considerably, while late varieties were generally unharmed. Some garden vegetables were nipped, but such damage was not extensive. The rainfall averaged about one-third more than the April normal, and most of it occurred prior to the 20th. During that period rains occurred almost daily, and kept the fields too muddy for seeding and planting. After the 20th the soil dried out very rapidly without enough rain to prevent its becoming hard and cloddy. Farmers rushed seeding for a time, but were compelled to slow up before the end of the month when oats seeding was about two-thirds done. Normally it should have been finished near the middle of the month. Corn planting was getting under way, in good season, at the close of the month. Truck gardening was seriously delayed, and was reported as being two weeks or more late. The accumulated excess of precipitation for March and April averaged nearly three inches despite a deficiency in the northern tier of counties. It was needed to partly make up a shortage of deep soil water that has existed for more than two years. The character of the rains was generally favorable for such a purpose as they were moderate and steady, and the run-off was comparatively light. Fairly heavy snows occurred in the northeastern counties with nine or ten inches in portions of Wayne County. The snow was moist and melted quickly, and there was little in the remainder of the State excepting Somerset County where there was about two inches.

TEMPERATURE.

The mean temperature for the State, as shown by the reports from 86 stations, was 50.9°, which is 2.2° above the April nor-

mal. The highest monthly mean was 55.6°, at Marcus Hook, and the lowest was 42.7° at Gouldsboro. Extremes for the month ranged from a maximum of 89° at Hyndman on the 29th, to a minimum of 15°, at Montrose on the 22d and at Kane (near) on the 23d. The greatest daily range in temperature was 51° at Lykens on the 24th.

PRECIPITATION.

The average precipitation for the State, as determined from the observations taken at 144 stations, was 4.49 inches, which is 1.05 inches above the normal for the month. The greatest monthly total was 6.20 inches at Hamburg, while the least, 2.19 inches, was reported from Warren. The greatest amount recorded in any 24 consecutive hours was 2.50 inches at Hamburg on the 17th.

Snowfall for the State averaged 0.5 inch, which is 1.8 inches less than the normal. The greatest monthly snowfall was 10.2 inches at Pleasant Mount, and the greatest snowfall for 24 hours was 9.0 inches and fell at Pleasant Mount and Freeland on the 12th.

CLIMATOLOGICAL DATA.

32

PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.

PHILADELPHIA, PA.

VOL. XXXVIII.

MAY, 1933.

No. 5.

GENERAL SUMMARY.

This was the warmest May since that of 1922, but with no unusual extremes. One or both extremes have broken in every May since that of 1916. It was a decidedly rainy month in nearly all parts of the State, there being an average of 18 days with 0.01 inch or more of precipitation. This is the greatest number of rainy days of record for the month of May. The average rainfall for the State, 5.86 inches, was fifty percent above the May normal. Seventy-three stations reported monthly totals in excess of 6.00 inches. The frequent rains kept the fields too wet and muddy for seeding and planting, which were seriously delayed. Most field operations were about ten days late at the beginning of the month, due to frequent rains early in the season, the excess rainfall for March and April averaging nearly three inches. Oats seeding, which normally is about finished in April, was continued into the fourth week of May. Corn planting began during the first week, on average time, but was not finished at the close of the month. Truck gardening progressed very slowly. The rains and excess temperature were favorable for wheat, rye, pastures, and meadows, which made a fine showing. Rye was headed, and wheat mostly headed at the close of the month, and the condition of both grains was much better than seemed possible early in the season. Pastures were never better, and a heavy crop of alfalfa was ready for cutting as the month closed. There were an unusual number of severe local storms with heavy resulting damage. A storm at Reading on the 20th did property damage estimated at \$75,000, and six persons were seriously injured. A tornado funnel cloud was seen in this storm, and a wind velocity of 70 miles per hour was recorded at the Weather Bureau office. The path of the tornado was only about 40 feet in width. On the same date a violent thunderstorm in York did damage estimated at \$100,000. A violent thunderstorm at Philadelphia on the 24th caused property damage variously estimated to exceed \$500,000. Six persons were killed and fourteen seriously injured in this storm. Hundreds of large trees were uprooted or broken off. A few buildings were unroofed and otherwise damaged, and thousands of windows were broken by hail. The damage to wire service alone exceeded a quarter-million of dollars. A wind velocity of 68 miles per hour at the Weather Bureau office exceed all previous records. A rainfall of 0.52 inch occurred in five minutes, and 1.54 inches in thirty minutes. A storm at Honesdale on the 31st resulted in damage estimated at \$35,000, chiefly by flooding. The monthly rainfall in that region was near the lowest for the State.

TEMPERATURE.

The mean temperature for the State, as shown by the reports

from 88 stations, was 62.2°, which is 2.8° above the normal for May. The highest monthly mean was 68.0°, at Marcus Hook, and the lowest was 53.1° at Gouldsboro. The highest temperature recorded during the month was 94° at Ardmore on the 27th, and the lowest was 24° at Arendtsville on the 6th. The greatest daily range in temperature for the month was 51° at Brookville on the 22d.

PRECIPITATION.

The average precipitation for the State, based on the reports from 148 well-distributed stations, was 5.86 inches, which is an excess of 1.96 inches above the normal. The greatest monthly total was 10.52 inches at Huntingdon, while the least was 2.17 inches, reported from Matamoras. The greatest amount recorded in any 24 consecutive hours was 2.80 inches at Greenville on the 24th.

The normal snowfall for the State is a trace, but no station reported any during the month.

VOL. XXXVIII.

JUNE, 1933.

No. 6.

GENERAL SUMMARY.

June as a whole was hot and dry with an abundance of sunshine. The rainfall averaged about forty per cent below the normal, it being the driest June during the last twenty years. Excessive rains in May had soaked the ground to a considerable depth, and helped to diminish the effects of the June shortage, but at the close of the month all vegetation was needing rain. The temperature excess was fairly large despite an unusually cold period with widespread frosts in the middle of the month. Maximum temperatures of 100 degrees or higher were recorded at twenty stations, and a new June high was established with 107 degrees at Sharon on the 8th. The growth and development of all crops, excepting the winter grains, was checked somewhat by the cold period from the 13th to 16th inclusive, and considerable damage was done to corn and truck crops by frost and freezing. A constant temperature excess during the last ten days stimulated the growth of corn, and ripened the winter grains rapidly, but had a damaging effect on pastures, meadows, and truck crops which were needing rain. Rye harvest was in progress and wheat harvest was beginning at the close of the month. Conditions during the last half of the month were favorable for haying, and a heavy crop was secured with small losses in curing. Pastures were excellent during the first half of the month, and then deteriorated slowly as the top soil dried out. Orchard fruits were not very promising. Apples promised a little more than half of a crop, or about the same as that of the preceding year. A small crop of cherries was gathered during the month. Strawberries were the best for many years, while raspberries and blackberries seemed better than usual. Many severe local storms were reported with considerable damage by winds, hail, and lightning. Two severe storms visited the Bethlehem region, one on the 8th and one on the 10th. Each of them did widespread damage, mostly of a minor character. Lightning was very severe, said to be the worst for many years, at Williamsport and Lock Haven on the 6th. On the 29th and 30th heavy storms were fairly general in the Delaware drainage basin, and occurred locally in other parts of the State. Many persons were injured by lightning, and three deaths were reported. At Jeddo, in the Hazleton district, an engine roundhouse was completely demolished by the wind, which is believed to have been a tornado although no funnel cloud was reported. Heavy hail fell at Greensburg on the 30th, and the cooperative observer reported

a hailstone that measured seven-and-one-half inches in circumference.

TEMPERATURE.

The mean temperature for the State, as shown by the reports from 84 stations, was 70.9°, which is 3.0° warmer than the June normal. The highest monthly mean was 77.2°, recorded at Sharon, and the lowest 60.8°, was reported from Gouldsboro. The highest temperature for the month was 107° at Sharon on the 8th, and the lowest was 28° at Somerset on the 15th. The greatest daily range in temperature was 52° at Hyndman on the 19th.

PRECIPITATION.

The average precipitation for the State, as shown by the reports of 146 stations, was 2.58 inches, which is a deficiency of 1.60 inches as compared with the June normal. The greatest monthly amount was 6.57 inches at Bloersville, and the least was 0.67 inch at New Castle. The greatest amount recorded in any 24 consecutive hours was 3.14 inches at Ardmore on the 26th.

CLIMATOLOGICAL DATA.

32

PENNSYLVANIA SECTION.

G. S. BLISS.

PHILADELPHIA, PA.

VOL. XXXVIII.

JULY, 1933.

No. 7.

GENERAL SUMMARY.

July averaged near the normal in both temperature and rainfall. A warm period that began the last week in June was broken on July 2d, after which the daily departures were small until a sharp rise began on the 29th, and the month closed intensely hot. The month began with a three days period of rains. At most places these rains constituted about one-half of the monthly precipitation, and there were no rains of consequence between the 3d and the 16th. In consequence, a muddy condition of the top soil changed to a hard, cloddy condition that made cultivation difficult and was detrimental to crops. Rains of the 16th and 17th were heavy enough to relieve this condition in about three-fourths of the State. During the last half of the month there were no heavy, general rains, but local showers were enough for needs in small areas totaling about one-half of the State. Elsewhere there were numerous complaints of local drought conditions. Wheat and rye harvest, which began near the end of June, was finished early in the month, about a week ahead of the usual time. The grains were discolored and otherwise damaged considerably by heavy rains while in the shock. The dry period between the 3d and 16th stunted oats at a time when the straw was developing, and a large part of the crop was so short that it was mown for hay. Corn grew rapidly in most places, and nearly made up the time that was lost by late planting. The greater portion of the crop was tasseled at the close of the month, and early fields were earing rapidly. Tobacco was not seriously affected by the drought, and made a good recovery after the rains of the 16th and 17th. At the end of the month it appeared to be about an average crop. Buckwheat was mostly in the regions of least rainfall, and was stunted beyond recovery. It promised to be one of the highest crops in recent years. There were the usual number of severe local storms. A severe electrical storm occurred in Williamsport and vicinity on the 1st in which several persons were injured, and buildings and trees damaged by lightning. Considerable damage was done in Gettysburg and vicinity on the 2d by a storm that seemed to be of tornadic character, although there were no reports of a funnel cloud. From the 22d to 25th inclusive severe storms occurred in many places. A heavy hailstorm in the region of Lock Haven on the 22d did damage estimated at upwards of \$100,000. On the same date lightning did much damage in Lebanon County. On the 24th excessive rains did much damage in Scranton, and on the 25th two men were killed by lightning near Philadelphia.

TEMPERATURE.

The mean temperature for the State, as shown by the reports from 87 stations, was 72.5°, which is 0.5° above the normal. The highest monthly mean was 78.6° at Marcus Hook, and the lowest was 61.5° at Gouldsboro. The highest temperature recorded was 104°, at Sharon on the 23d. The lowest temperature recorded was 35° at Mt. Pocono on the 4th. The greatest daily range in temperature was 50° at Franklin on the 27th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations taken at 145 well-distributed stations, was 4.26 inches, which is 0.03 inch less than the July normal. The greatest monthly amount was 9.13 inches at Lancaster, and the least was 1.12 inches at Erie. The greatest amount recorded in any 24 consecutive hours was 4.95 inches at Bloersville on the 2-3d.

AUGUST, 1933.

No. 8.

GENERAL SUMMARY.

An intensely hot period that closed July continued on August 1st and 2d, after which the temperatures were mostly seasonable. The high temperature of 104° has been exceeded in August, during the last 45 years, only in 1918 and 1930. The chief feature of the month was the excessive rains in the eastern half of the State, occasioned by the passage of a tropical storm. The rains of this storm began on the 22d, a full day before the storm winds reached this region, and continued over a three days period. They constituted about three-fourths of the monthly rainfall for the eastern half of the State, which exceeded ten inches at 46 stations. The region of heaviest rains was mostly southeast of the Blue Ridge, and included the finest agricultural regions of the State. The rains of the 22d soaked and softened the top soil, and when the torrential rains and gales passed over the region on the 23d and 24th the greater portion of the corn was beaten to the ground. About two-thirds of the crop was fully and heavily eared, and was down to stay down. The leaves and stalks dried and shriveled after the storm in the same manner as if they had been frozen. Late fields that were in the earing process straightened up to a considerable extent, and made a fair recovery. The damage was estimated as high as fifty percent in some sections, and seems to have averaged nearly thirty percent for the eastern half of the State. This loss was partly balanced by the improvement that moderate rains caused at most places in the western half of the State. The storm covered practically all of the tobacco growing regions, and nearly ruined the crop. One of the most promising crops in recent years, it was apparently reduced one half in yield, while quality suffered even more. A poor crop of orchard fruits was apparently reduced about one-half in the storm region. Analysis of the three-days rainfall during the storm shows amounts in excess of six inches at 43 stations. York had a three-days rainfall of 13.82 inches, and a monthly total of 17.70 inches, breaking all existing records for the State. It previously held a record of 11.00 inches in less than 48 hours on June 25-26, 1884. Flooding of the streams caused heavy damage in the Delaware drainage area. The Schuylkill reached a stage of 19.7 feet at Reading on the 24th, nearing the all time record of 23.2 feet on September 2, 1850. A large area was flooded in the southern portion of the city. Basements were filled and the first floors of hundreds of homes and business places invaded by the flood waters. All of the towns along the river from Reading to Philadelphia suffered more or less damage. No complete survey was made of the losses, but numerous reports make it seem that a million of dollars would be a conservative estimate. The State Highway Department estimated the damage to roads and bridges at upwards of \$800,000. The crop damage undoubtedly exceed-

ed the total flood damage by a wide margin. The storm was the most destructive that Pennsylvania has experienced during the 45 years of the State Weather Service.

TEMPERATURE.

The mean temperature for the State, as deduced from the reports of 86 stations, was 70.8°, which is 0.8° above the normal for August. The highest monthly mean was 77.7° at Marcus Hook, and the lowest was 60.6° at Gouldsboro. Extremes of temperature ranged from a maximum of 104° at Phoenixville on the 1st to a minimum of 38° at Coudersport on the 30th. The greatest daily range in temperature was 48° at Ridgway on the 2d.

PRECIPITATION.

The average precipitation for the State, as shown by the reports from 146 stations, was 7.61 inches which is 3.44 inches above the August normal. The greatest amount for the month was 17.70 inches at York, while the least, 1.22 inches, occurred at Grove City. The greatest amount recorded in an 24 consecutive hours was 8.48 inches at York on the 22-23d.

PENNSYLVANIA SECTION.

G. S. BLISS.

PHILADELPHIA, PA.

VOL. XXXVIII.

SEPTEMBER, 1933.

No. 9.

GENERAL SUMMARY.

Temperatures and rainfall were above the normal in nearly all parts of the State. Temperatures were constantly above the normal during the first ten and last seven days of the month, the greatest departures being from the 25th to 27th inclusive, although the highest temperature for the month occurred at many stations on the 8th. The minimum for the State, of 32°, was higher than usual for September. In fact, lower temperatures have been recorded every September since 1910. Two periods of heavy general rains were responsible for the excess that was reported in more than four-fifths of the State. The first heavy rains occurred on the 3d and 4th, and covered practically the whole State. They were especially heavy in a few northwestern counties where a severe drought condition had developed in July and August. The second period of heavy rains was from the 14th to 16th inclusive. During that time heavy local showers were numerous in the Delaware and Susquehanna basins, while the rainfall in the Ohio drainage was generally moderate. These rains were generally helpful in the western half of the State in restoring pastures and late truck crops. They were too late to help corn or potatoes. September brought near to its close a crop season that was unfavorable in many respects. Late frosts in spring caused serious damage to the fruit crop, and a tropical storm in August, the most destructive during the last forty years, caused widespread damage to crops in the eastern half of the State. This storm occurred at a time when the greater portion of the corn was fully and heavily eared. It was beaten down to stay down, with the result that cutting proceeded very slowly in September. The ears of corn matured better than seemed possible just after the storm, but the losses to the fodder were very heavy. The excessive rains in the eastern half of the State were harmful, rather than helpful to potatoes, causing a marked increase in blight and rot. Wheat seeding was ready to begin about the middle of the month when the heavy rains of the 14th to 16th caused a delay of nearly a week for the soil to dry out to a workable condition. As a result it was still in progress, though well advanced, at the close of the month. The monthly rainfall in Carbon and Monroe counties was in excess of ten inches, and flooded many mines. No estimate of the damage can be made.

TEMPERATURE.

The mean temperature for the State, as shown by the reports from 89 stations, was 66.3°, an excess of 2.2° as compared with the September normal. The highest monthly mean was 71.6° at Marcus Hook, and the lowest, 56.6° at Gouldsboro. Extremes for the month ranged from a maximum of 98° at Sharon on the 8th, to a minimum of 32°, at Corry on the 12th. The greatest daily range in temperature was 47°, and occurred at Brookville on the 11th, and at Ridgway on the 12th.

PRECIPITATION.

The average precipitation for the State, as determined by the reports of 143 well-distributed stations, was 4.66 inches, which is an excess of 1.20 inches as compared with the September normal. The greatest monthly amount was 11.67 inches, at Mauch Chunk, while the least, 2.23 inches, occurred at Ridgway. The greatest amount recorded in any 24 consecutive hours was 7.01 inches, at Mauch Chunk on the 3d-4th.

CLIMATOLOGICAL DATA.

32

PENNSYLVANIA SECTION.

G. S. BLISS.

PHILADELPHIA, PA.

VOL. XXXVIII.

OCTOBER, 1933.

No. 10.

GENERAL SUMMARY.

The average temperature for the month was slightly below the normal with no new records for extremes. The maximum of 90° for the State has been equalled or exceeded in 21 of the last 45 Octobers. The minimum of 11° has been equalled or exceeded only three times. Killing frosts covered fully three-fourths of the State on the 14th, which is about the usual condition. The coldest period of the month centered about the 26th, and ended the crop season wherever growing vegetation remained. The rainfall was light in all parts of the State with the greatest deficiencies in a few southwestern counties. Accumulated departures from normal precipitation from January to October inclusive show a deficiency of about nine inches at Erie, and an excess of more than thirteen inches at Philadelphia. Weather conditions were especially favorable for field work, which made excellent progress. Corn cutting was practically finished by the 10th, and husking was under way. Cutting was rather slow by reason of the lodged condition occasioned by the August storm. The grain matured better than expected although considerable soft and moldy corn was reported in the southeastern portion of the State. The losses of fodder were heavy. Silage corn was not far enough advanced to be seriously damaged by the August storm, and the yields were heavy, making up to a large extent for the loss of fodder in the main crop. Potato digging continued throughout the month, and yields were generally better than anticipated, especially in Lehigh and Potter counties. Buckwheat was threshed during the month, and yields exceeded earlier estimates. The crop had suffered much from drought at about the time the grain was filling, and after it was harvested it was damaged by heavy rains while in the field. The outlook was anything but promising, yet yields were mostly fair. Tobacco suffered a greater loss in quality than in yield. Some fields were practically ruined by the August storm, but in general there was a fair yield of tobacco of the filler quality, while there was very little suitable for wrappers. Late apples and pears were gathered during the month. Apples were light in yield and poor in quality, being generally undersized and unusually wormy. Pears turned out a little better than early estimates indicated. Fall seeding was finished early in the month, and the grains came up to good stands, and made a good growth. The top soil was deficient in moisture at the close of the month, and the water supply was getting low in many places.

TEMPERATURE.

The mean temperature for the State, as shown by the reports from 89 stations, was 51.6°, a deficiency of 0.8° as compared

with the October normal. The highest monthly mean was 59.4°, at Marcus Hook, and the lowest, 41.8°, at Gouldsboro. Extremes for the month ranged from a maximum of 90°, at Phoenixville on the 1st, to a minimum of 11°, at Wellsboro on the 26th. The greatest daily range of temperature was 48° at Claysville and Uniontown on the 15th.

PRECIPITATION.

The average precipitation for the State, as determined by the reports of 146 well-distributed stations, was 1.91 inches, which is 1.35 inches below the normal for the month. The greatest monthly amount was 3.80 inches, at Freeland, while the least, 0.33 inch, was reported from Irwin. The greatest amount reported in any 24 consecutive hours was 1.94 inches, at Pottsville on the 17th. The average snowfall for the State was a trace, which is 0.2 inch less than the normal for October. The greatest amount of snow for the month was 1.2 inches reported at Erie, which amount fell on the 18th. Several stations reported traces on the 18th, 25th and 26th.

PENNSYLVANIA SECTION.

G. S. BLISS.

PHILADELPHIA, PA.

VOL. XXXVIII.

NOVEMBER, 1933.

No. 11.

GENERAL SUMMARY.

November was a month of great temperature extremes. It began and ended with mild temperatures, the highest for the month being generally recorded on the 1st, 2d, or 30th. It was unseasonably cold from the 4th to 19th inclusive, and on the 16th and 17th the lowest temperatures of record for so early in the season were reached at several stations. On those dates the minimum temperatures were generally below zero in the northern tier of counties. The average of 38.1° for the State was the lowest November temperature since 1917. The maximum of 83° for the State was exceeded in 1927 and equalled in 1896. With those exceptions it was the highest November temperature of record. The minimum of 11° below zero was exceeded only in 1930, which recorded 15° below zero. The temperature range of 94° was the greatest of record for November. This was the driest month of the year to date, the average precipitation of 1.55 inches being a little more than one-half of the November normal. Precipitation was heaviest in the northwestern counties, being a little above the normal at a few stations, and was very light in the south-central and southeastern counties. This distribution helped to even up the accumulated departures for the year, but still left a deficiency of 9.77 inches at Erie, and an excess of 11.87 inches at Philadelphia. The greater portion of the precipitation, excepting a few southeastern counties, was in the form of snow, which was light in texture and of little water content. The average snowfall of 7.0 inches for the State has been exceeded only in 1910 and 1892. The heaviest monthly snowfall was 60.5 inches at Corry, in the southeastern corner of Erie County. At that station there was a measurable quantity of snowfall on fifteen successive dates, from the 5th to 17th inclusive. Excepting the south-central and southeastern counties, the ground was snow covered a little more than one-half of the month, and the winter grains were preserved in good to excellent condition. In the excepted regions the top soil became very dry, and the grains began to turn yellow. The surface water supply was getting low at the end of the month, especially in the eastern half of the State.

TEMPERATURE.

The mean temperature for the State, as shown by the reports from 88 stations, was 38.1°, which is 3.1° below the November

normal. The highest monthly mean was 45.4°, at Marcus Hook, and the lowest was 28.5°, at Mount Pocono. Extremes for the month ranged from a maximum of 83° at Beaver Dam on the 2d to a minimum of -11° at Coudersport on the 16th. The greatest daily range in temperature was 45° at Somerset on the 17th.

PRECIPITATION.

The average precipitation, from rain, sleet and melted snow, for the State, as deduced from the observations of 144 stations, was 1.55 inches, which is 1.31 inches below the November normal. The greatest monthly amount was 5.21 inches at Corry, while the least, 0.51 inch was recorded at Ephrata. The greatest amount recorded in any 24 consecutive hours was 1.12 inches at Meadville on the 10th. Snowfall averaged 7.0 inches, which is 4.5 inches above the November normal. The greatest monthly snowfall was 60.5 inches at Corry, and the greatest 24 hour fall was 12.0 inches at Meadville on the 10th.

The departures from normal temperature and precipitation are computed only from records for stations that have ten or more years of observation, but all complete reports are used in determining means for the State. † On other dates also. * Incomplete.

Reference letters, ^a, ^b, ^c, etc., indicate, respectively, 1, 2, 3, etc., days missing from the record. T, indicates precipitation less than .01 inch, rain or melted snow

If Post-Office addresses are as follows: of Beaver Dam, Beaver; of Elk Lick, Grantsville, Md; of Lycippus, Greensburg; of Neshaminy, Oakford; of Sharon, Farrell; of Shawmont, Manayunk; of Kane (near), Wilcox.

PENNSYLVANIA SECTION. JAN 28 1934

G. S. BLISS.

PHILADELPHIA, PA.

VOL. XXXVIII.

DECEMBER, 1933.

No. 12.

GENERAL SUMMARY.

December was a generally gloomy month on account of excessive cloudiness, especially in the western portion of the State. At Erie the sunshine was only 8 per cent, and at Pittsburgh 30 per cent of possible. The first week was mild and the second week unseasonably cold, after which mild conditions prevailed up to include Christmas. The highest temperature for the month was recorded at many stations on the 24th. There was no snow on the ground for the Christmas Holiday, but heavy snows were general on the 26th, after which it was intensely cold for four days. The temperature started on an upward trend on the 31st. The highest temperature for the month, 74 degrees, has not been equalled in December since 1912. The lowest temperature, 22 degrees below zero, has been exceeded only five times in the last 46 years. The monthly range of 96 degrees was exceeded by one degree in 1914. It will seem, therefore, that it was a month of unusual extremes. Following the dry months of October and November, the precipitation for December rose nearly to the normal. The snowfall was a little more than the average, and fields were generally well covered during the coldest periods. Rains were barely enough to prevent a further diminution of the surface water supply, and streams generally remained at low stages throughout the month. Sleet and ice covered the highways in nearly all parts of the State on the 13th and 14th, delaying traffic and causing hundreds of accidents. With that exception the highways were mostly in good condition until after Christmas, when many were blocked by snow. The ground was practically free from frost about one-third of the month, and some plowing was reported. Despite the snow cover, the winter grains were not in as good condition as might have been expected or desired. They were generally reported as fair to good with the prevailing condition fair. Outdoor work of most kinds made as good progress as is usual for December. Temperatures were too low for concrete work about one-half of the month. Farmers were largely employed in butchering and in hauling and spreading of manure.

TEMPERATURE.

The mean temperature for the State, as shown by the reports from 92 stations, was 31.7°, or 0.6° above the December normal. The highest monthly mean was 38.2°, at Donora, and

the lowest 22.8°, at Gouldsboro. The highest recorded during the month was 74° at Marcus Hook on the 1st, and the lowest was -22° at Montrose on the 29th. The greatest daily range in temperature was 55°, at Ridgway on the 30th.

PRECIPITATION.

The average precipitation, from rain, sleet and melted snow, for the State, as deduced from the records of 146 stations, was 2.88 inches, which is 0.28 inch less than the normal for the month. The greatest monthly amount was 6.01 inches at Clymer, and the least was 1.30 inches at Montrose. The greatest amount recorded in any 24 consecutive hours was 1.41 inches at Pleasant Mount on the 16-17th. Snowfall averaged 8.7 inches, which is 0.5 inch above the normal for December. The greatest total snowfall for the month was 20.0 inches, at Corry; the greatest fall in 24 hours was 9.0 inches at George School, Gratersford and Lakeville on the 26th, and at Clymer on the 11th.

PENNSYLVANIA SECTION,

G. S. BLISS.

PHILADELPHIA, PA.

JUN 28 1934

VOL. XXXVIII.

ANNUAL SUMMARY, 1933.

No. 13.

GENERAL SUMMARY.

The year as a whole was moderately warm, while the precipitation averaged about seven per cent above the normal. The only months that gave a temperature deficiency were March, October and November. Seven months showed deficiencies in precipitation which were more than balanced by the excess amounts of the other five months. January was the warmest of record with the single exception of 1932, and its snowfall was only about one-sixth of the January average. Frost did not penetrate the ground deeply at any time, and the winter grains were not damaged despite the lack of snow cover. Severe wind storms occurred on the 26th and 28th, and did much damage to trees and wires. Conditions were unusually favorable for outdoor work. February was moderately warm excepting a four-day period which began with a cold wave on the 8th. Precipitation was generally deficient excepting the Delaware drainage, where heavy snows occurred on the 11th under the influence of a coast storm. The heaviest snows were on the Pocono Plateau, where the ground was snow covered nearly the whole month. March more than lived up to its reputation for being a windy and blustery month. Its precipitation was the heaviest for any March of record, while a moderate temperature deficiency was added to the other disagreeable features. Winter grains suffered a heavy depreciation, and outdoor work made slow progress. April temperatures averaged well above the normal, and yet severe frosts occurred later in the month than usual, and seriously damaged the fruit crop. Fairly heavy snows occurred in the northeastern counties. May was the warmest since that of 1922, but with no unusual extremes. Severe local storms occurred in many parts of the State. A small tornado at Reading did damage estimated at \$75,000, while an unusually severe thunderstorm at Philadelphia destroyed hundreds of large trees and damaged wires and other property upwards of \$500,000. Six persons were killed and fourteen seriously injured. A thunderstorm at York did damage estimated at \$100,000. June was a month of unusual temperature extremes. Maximum temperatures of 100 degrees or higher were recorded at twenty stations, and a new June high was established with 107 degrees at Sharon on the 8th. At the other extreme was a severely cold period from the 13th to 16th inclusive with considerable damage to corn and truck crops by frost and freezing. July averaged near the normal in both temperature and rainfall, with an intensely hot period to close the month. The chief characteristic of August weather was a severe tropical storm that covered the eastern half of the State on the 23d and 24th. It was the most destructive storm of record for Pennsylvania. When its torrential rains and gales of wind passed over that region the greater portion of the corn was beaten to the ground. About two-thirds of the

crop was heavily eared, and was down to stay down. This storm covered practically all of the tobacco growing regions, and nearly ruined the crop. Orchard fruits, which were already poor, were reduced by nearly one-half in the storm region. Analysis of the rainfall shows amounts exceeding six inches for 43 stations. York had a three-days rainfall of 13.82 inches. Damage to highways and bridges was reported to exceed \$800,000. The flooding of the Schuylkill did damage of about a million of dollars. September was warm, rainy, and generally favorable. Its rains were very beneficial to pastures and truck crops in the western half of the State, but were too late to help corn or potatoes. October was cool and dry, but very pleasant. November was a month of great temperature extremes. It began and ended with mild temperatures, but was unseasonably cold from the 4th to 19th inclusive, and lowest temperatures of record for that period were reported from several stations. The snowfall was the heaviest of record since 1910. December was a gloomy month on account of excessive cloudiness. At Erie the sunshine was only 8 percent of possible.
